[1] Slip resistance was determined in accordance with Appendix A of AS 4586:2013 "Slip resistance classification of new pedestrian surface materials" using a Slider 96 (4S) rubber slider.

[2] According to Table 3B of the Standards Australia Handbook HB198:2014 – "Guide to the specification and testing of slip resistance of pedestrian surfaces"

[3] 5.2 of HB198 states: "The use of these values should be in the context of design, which also considers abnormal wear, maintenance, abnormal contamination, the presence (or otherwise) of water or other lubricants, the nature of the pedestrian traffic (including age, gait and crowding), the footwear (or lack thereof), slope lighting and handrails."

[4] According to HB198, *Wet areas* are, "...those areas that are not defined as a dry or transitional area, which may be either constantly or intermittently wet or otherwise contaminated."
